(57) Abstract:

PROBLEM TO BE SOLVED: To improve the reality of an article by enabling a user to select the article displayed on the home page or the like of the Internet and to easily move the image of the selected article.

SOLUTION: The ID of the article selected by the user is transmitted to a server, and in the server, a video concerning the ID of the article and the data of a slider are retrieved. On the basis of the video concerning the ID of the article and the data of the slider distributed from the server, an expanded image or three-dimensional model 210 of the article and a plurality of sliders 205, 611 and 612 attached to the relevant data are

simultaneously displayed on a display screen 601. While being interlocked with the tracking motion of a pointer or finger along one arbitrary slider 205, the video of an article 210 of a posture (rotation) corresponding to a pointed position on the slider is successively displayed on a display picture 602. Corresponding to the operation of an order button 620, the relevant article is ordered by the server and electronic money settlement is performed.
